Hi,

Thanks for your answer.

I have some more questions related to your suggestions:

In my case the light is travelling through some optic fibers. How can I detect if there are fluctuations in the intensity of a light ray? These fluctuations can appear at very small intervals of time (nano seconds or even smaller (pico)). I need a device which can notify me about these occurrences. Can I use an oscilloscope? Or this device is used only for electric power? Or, which devices are used for measuring the changes in the intensity of a light ray?

Thanks,
Laura
