I wasn't completely precise. What is field of study of neurophysiology?

Ok. I'll try. Human mind is a constant process that mostly happens within framework of our bodies. It is not organ, nor has any specific location.

I think that mind is beautiful product of extremely complex processes

that happens within our body. Mind is so complex that

it can willingly escape any scientific prediction about it.

>

> *Is your mind in your head?*

Intuitively one experiences intellect to be centered in head(brain) and feelings in chest.

> *Is it in your spleen? Is it in your body?*

Not really.

Our minds communicate via computers. We can write what we thought and feel. If such data exists only within brain, there must be way to reconstruct and write *\*exact\** thought and feeling. So far, no such thing is reconstructed by scanning and recording brain activity.

Where does your mind go when you die. Your brain rots. Does  
> *your mind rot or does it float up to heaven to be with God?*

I think that there is no God beyond our mind, nor there is mind without body.

Greetings, Bane.
