Truth is: I CAN show how the de Brolgie wavelength Equation can CORRECTLY describe the electron pilot wavelenghts of the atom (and give the correct wavelengths of the photons emitted by an electron as it jumps orbits) whereas current QM and Relativity CAN NOT. Unless you can show us how it is done using current QM then you are obviously the crackpot bozo because I have posted DIRECT, ABSOLUTE proof on my website. Here it is:

wavelength = h / Energy of orbit [N]
of orbit [N] _____ X (c^2 − [orbital])^2
c^2
velocity

For example the observed wavelength of [N1] orbit = 9.12 x 10^−8 meters *

Now, using the above formula from Reality Physics:

wavelength [N1] = h / 13.6eV / c^2 x 299,992,017m/sec

= 9.12 x 10^−8 meters *

So, I say to you, either disprove it, or shut−up.

all the best,
