[begin quote]

The following astronomical description by Newton is the single greatest indication that he unfortunately scrambled the insight of Roemer with Keplerian motion hence the tangle every time contemporaries open their mouth on finite light distance.

PHÆNOMENON V.

Then the primary planets, by radii drawn to the earth, describe areas no wise proportional to the times; but that the areas which they describe by radii drawn to the sun are proportional to the times of description.

For to the earth they appear sometimes direct, sometimes stationary, nay, and sometimes retrograde. But from the sun they are always seen direct, and to proceed with a motion nearly uniform, that is to say, a little swifter in the perihelion and a little slower in the aphelion distances, so as to maintain an equality in the description of the areas. This a noted proposition among astronomers, and particularly demonstrable in Jupiter, from the eclipses of his satellites; by the help of which eclipses, as we have said, the heliocentric longitudes of that planet, and its distances from the sun, are determined."

A genius cannot tolerate inferiority or insincerity and Newton displays both attributes in abundance. He is a theorist who imagines he is an astronomer as are all those who follow the empirical cult.

There is no crisis in cosmology as some would have it for basically you are reaping what was sowed a few hundred years ago, by not co-operating with me or among yourselves you managed to create a particularly nasty situation for the first time in the history of the investigation of natural phenomena and threaten to take down everything with the
