Multiple misunderstandings here.

1. I wasn't referring to any specific paradox, but it is my impression that relativity requires that there be no absolute frame of reference, and if there is one, that paradoxes arise. If that is not so, please ignore the phrase "in an absolute frame".
 2. I used emotionally loaded words – sorry. What I meant by "shoved over into philosophy" was simply that instead of saying "we don't know yet", physicists are saying "that's not our department". I would suggest that there is a universe out there that gives rise to many questions – some we need measurements to answer, some can be answered by careful logic alone (eg. cogito ergo sum). All questions are the province of any field, if not to answer (yet), at least to defend. If philosophy shows some physics theory to be illogical, then it's time to modify it, not build a wall.
