Re: "How Does Light "Know" How Fast to Travel?"

|> |> If I drop a cannonball in the ocean it doesn't fall as fast to the
|> |> ocean floor as it would if I dropped it a similar height in air.
|> |> We call the water and air "media" and it is this medium that
controls
|> |> the descent to the ocean floor.
|> |
|> | Yah but i think you ment vice-versa
|>
|> I meAnt exactly what I said.
|
| Well I explained why vice-versa below which is common knowledge, space
| or the atmospher is known as a medium not a media.

| media is the information (news media) and not the carrier, the carrier
| is the medium.

I meant exactly what I said, no matter what you thought I meant or what
you attempted to explain. It is common knowledge that "media" is the plural
of "medium".

Main Entry: me-di-um Pronunciation: 'mE-dE-&m
Function: noun
Inflected Form(s): plural mediums or me-dia

Etymology: Latin, from neuter of medius middle -- more at MID
1 a : something in a middle position b : a middle condition or degree
: MEAN
2 : a means of effecting or conveying something: as a (1) : a
substance regarded as the means of transmission of a force or effect (2) : a
surrounding or enveloping substance (3) : the tenuous material (as gas and
dust) in space that exists outside large agglomerations of matter (as stars)
<interstellar medium> b plural usually media

Don't try to teach an Englishman plain English.

Correct, media is known as a plurality to medium but it can also be the
info carried by the medium

medium definition: middle between two ends, such as wire and an
information carrier.

media defintion: "Messages that are distributed through the
technologies, principally text in books, study guides and computer
networks; sound in audio-tapes and broadcast: pictures in video-tapes
and broadcast; text, sound and/or pictures in a teleconference."

Re: "How Does Light "Know" How Fast to Travel?"

Re: "How Does Light "Know" How Fast to Travel?"

The above has a plurality but as well it is not the books nor tapes, instead it is the info that is in the books and tapes which is the text(media) in the books (medium), the sound(media) in the audio-tapes, the pictures (media) in the video-tapes(media). etc...

|>
|> Prove a cannonball has mass and a photon does not.
|
| Hey it's not my theory, there the ones that argue photon should only be
| considered as momentum.

I'm not interested in hearsay. You are the one proposing it to me. I'm challenging YOU.
Prove a cannonball has mass and a photon does not.

Now, your being unreasonable, no one presently can prove it and you

Re: "How Does Light "Know" How Fast to Travel?"

know that, therefore it means you're starting to get carried away....
The present theory in the books (not my books) is that photons have no mass and only momentum. I do not pretend to be able to contradict them, nor anyone in this newsgroup.

|
| > Tell me how to got about measuring it, and while you at it,
| > how to go about measuring the mass of this "Eather" you've
| > heard of.
|
| Oh yeah, prove there's an invisible wall said Androcles just before
| smashing into it.

Yes, prove Androcles ever smashed into an invisible wall.

| Maxwell's equation applies to the permeability and permitivity of ANY
| medium,

"It is known that Maxwell's electrodynamics—as usually understood at the present time—when applied to moving bodies, leads to asymmetries which do not appear to be inherent in the phenomena."

That was written over 100 years ago, 1905 to be precise.

all I'm saying is why should space receive the exception and

| notably because c is not infinite but restrcted to the porosity of
| space (permittivity and permeability = porosity/opacity of a medium).

All you are saying is bullshit, the opacity of space is OBVIOUSLY non-existent.

Computer store colors in a range from 0 to 255, the higher the number the more color in the picture.

Likewise for permittivity the lower this number the faster the velocity ("c").

For the sake of comparison, permittivi is say 22 (out of 255) instead of 0.

#1. If space is truly void then why is it's number 22 and not zero?

Re: "How Does Light "Know" How Fast to Travel?"

Re: "How Does Light "Know" How Fast to Travel?"

#2. If #1 is IRRELEVANT to determining a "void" then why are ALL other medium's permittivity above that of space?

#3. Why is the higher the permittivity the more time it takes to travel through the medium since the maximum possible velocity ("c") in the medium is proportionally LESS?

Since space is not "0" but instead say "22" in terms of permittivity, and as well since it regulates the maximum velocity possible AND the maximum amount of energy(quantum for space, current/coulomb for electrical wires) that can pass through this medium(space or wire) per unit of time....

|
|-----
|

| 1. What is strange is that the permeability/permittivity of an electric
| circuit is not necessarily measured by the conductivity of the wire
| (medium) but instead of the dielectric (metamorphose as the singularity
| of big bang) value of the capacitorwhich also regulates the "rate"
| of time in the circuit.

What is strange is that you know sweet fuck—all about it and are trying to con me.

<http://www.androcles01.pwp.blueyonder.co.uk/AC/AC.htm>

quote:"Both these spaces are empty, although it is possible to fill them with matter such as air."

I believe not only the air determines the permittivity but the thickness of the air (meaning the distance between the plates)...call it what you like but is specifically known as a SEMI-conductor, if it was 100% insulation or 100% conductor you would not have 0% or 100% permittivity.

And if you have 0% or 100% permittivity, you have no capacitance, no capacitance means no capacitor(power source), no capacitor and you no magnetic field.

|
| 2.

Re: "How Does Light "Know" How Fast to Travel?"

|
| a) I believe Einstein's relativity applies to any medium

That's an article of your faith, not mine.

<http://www.androcles01.pwp.blueyonder.co.uk/Smart/Smart.htm>

No my faith but Maxwell's and Einstein's:

$(\text{Maximum velocity of medium})^2 = 1 / (\text{permittivity of medium} * \text{pemeability of medium})$

$E = M c^2 = M / (\text{permittivity of medium} * \text{pemeability of medium})$

and not just

| space and since "c" is smaller the more dense (less porous) the medium
| thus a smaller "c" value would probably be needed to observe time
| dilation when traveling in a medium denser than space....although you
| would still need infinite Energy since the medium is less travelable
| than space.

|
| b) The main aspect of part (a) above is that even though there is
| Relativity since we noticed that "maximum" velocity is not always "c" but
| varies with the permeability and permittivity of the medium therefore
| could there still be an absolute frame of reference for the universe
| "REGARDLESS" of relativity....for both the dimensional position vectors
| and the Rate of Time.

|> | thus in this

|> | instance the cannonball would be a conglomeration of inter..active

|> | photons.

|> |

|> | secondly the cannonball does not generate the waves the waves are the

|> | perturbations from the displaced air medium (versus the air's ability

|> | to dampen all waves....aftershock).

|> |

|> | This cannonball on a spring has waves:

|> | <http://www.kettering.edu/~drussell/Demos/SHO/damp.html>

|
| the spring is the wave, the cannonball is the force through gravity
| applied to it.

There was no mention of gravity.

Re: "How Does Light "Know" How Fast to Travel?"

Re: "How Does Light "Know" How Fast to Travel?"

As you wish ...then the cannonball with a momentum

The oscillator still works in the horizontal plane, that's why balance wheel clocks were devised in preference to pendulum clocks.

As I said, the cannonball is NOT the wave, the spring is the wave and causes the cannonball to oscillate.

|
| > See? Wave-particle duality.
| > What is the wavelength of the waves?
| >
| >
| >
| > |
| > | > You'll be telling me next that cannonballs cannot exceed the speed of
of
| > sound,
| > | > the frequency becomes infinite.
| > |
| > | I'll let you and the reader do the math.
| >
| > Because you cannot.
| > I'll let the reader draw his conclusions on your capabilities.
|
| I believe you would be contradicting Planck's theory and the Quantum
| theory and Einstein.

I'm not responsible for your faith or beliefs.

It is not "my" faith, it is the present belief.

| The higher the relativistic mass the higher the
| Energy needed to reach higher velocity.

I don't believe you, prove it.

You need an infinite energy to "ACCELERATE" any mass to the speed of

Re: "How Does Light "Know" How Fast to Travel?"

Re: "How Does Light "Know" How Fast to Travel?"

light. Likewise to accelerate mass near the speed of light and likewise the more energy needed the higher this mass to be accelerated to near the speed of light.

I proved by as Christ said the unbelievers manage to find a away around the evidenceand ridicule it.

...the present understanding the
| higher the mass then infinite Energy needed to accelerate to the
| velocity of "c".
|
| In a circuit if the Energy applied is higher than the permittivity and
| permeability of the capacitor's dielectric then the dielectric ruptures
| and/or the circuit's copper wire (medium) melts.

Superconductors do not melt. Capacitors range from a few picofarads to farads, and some are polarised.

You're not contradicting my statement only elaborating on it. I said perhaps wires as well, superconductors are not capacitors.

|
|
|>
|> | Let's just saying using Maxwell's equation the velocity of c in water
|> | would be related to that similar in space which is:
|> |

|>
|>
|> Let's just say that the volume of a gas at zero degrees Kelvin in zero.
|> Let's just say that the speed of sound in space is infinite.
|> Let's just say bright green flying elephants lay eggs in black holes.
|
| I knew it! Dumbo's my favorite one!!! Shhhh!

I knew it, you are a bullshitter.

Just because I like dumbo?

Actually bullshit is volume = 0 because temperature = 0

This is not bullshit and is Maxwell's equation for ANY MEDIUM not just

Re: "How Does Light "Know" How Fast to Travel?"

Re: "How Does Light "Know" How Fast to Travel?"

space:

$(\text{maximum velocity or "c"})^2 = 1 / (\text{permeability of medium} * \text{permittivity of medium})$

| Are you saying the value of c doesn't change with the medium it travels through....and yet this discovery is not too long ago.

I'm saying that space has no permittivity or permeability. This discovery was made in 1896 by Michelson.

I think your drunk...and you mean no ether.

Maxwell's equation for space: $c^2 = 1 / (\text{permeability of space} * \text{permittivity of space})$

Just because the velocity of light is the same in ALL DIRECTIONS in water does not mean there is no water, likewise for the ether.

| >

| >

| > | As well as the direct linear interpolation that the higher the density

| > | (and/or porosity, opacity, etc...) of the medium then the higher the

| > | permeability and permittivity of the medium.

| >

| > Space is not a medium. It is NOTHING.

|

| Maxwell's equation contradicts it.

So Maxwell's equation was wrong.

| You obviously have a peeve with that.

You obviously have a peeve with that.

| Can you say the invisible is green....no....it's invisible?

Can you say the green is invisible... no... it's green.

|

| Maxwell's permeability and permittivity is not only for space.

Maxwell's permeability and permittivity is only for not space.

Re: "How Does Light "Know" How Fast to Travel?"

| When they speak of permeability....it's the permeability OF THE MEDIUM.

Space has no medium.

| Example:

| the conductivity.... same as the conductivity of the medium, therefore
| the conductivity would HAVE to be ZERO (infinite) for there not to be a
| medium since the conductivity is not invisible(not zero but green) thus
| there is a medium....for space because of Maxwell's equation, the
| permittivity and permeability are not zero therefore there is a medium
| known as the Ether

Michelson proved you wrong. I'm not convinced by your fantastic beliefs,
I'm convinced by a scientist.

Learn Galilean Relativity.

<http://www.androcles01.pwp.blueyonder.co.uk/Wilson/SpinWilson.htm>

Androcles.
