The study bug has bit and I have decided to actually enroll in a degree in physics.

Because my math degree is 25 years old now they won't give me exceptions for the math. Not really a problem; don't mind a bit of revision. Does anyone have and ideas on some good prereading other than the obvious Feynman lectures, Landau etc that I already have? I really would like to hear from guys like PD, Bilge etc that actually teaches/has taught this stuff, but any comments most welcome.

It's so great when people decide to pursue educational experiences for pure intellectual enjoyment. You are a delightful person, Bill, and I fully expect you will have a wonderful time.

Re: Course Pre Reading

GAG, who want's an old fossil plugging up  
the education system? A university is NOT  
an OLD FOLK's HOME.

If he can't muster the resources to learn the  
material – for himself – at his age, he never will.

Ken

I hope thats sarcasm.

I'm a mature student in his late 30's 3/4 of the way through a physics  
masters. Education should never be restricted, or the sole property of one age  
group. Agism really pisses me off.
