(seed = Big bang's singularity)

I proposed the limits (circumference) of space's continuum are represented by an outer shell in two forms:

1st form: the shell expands

2nd form: all though the shell expands there is a restrictive forces on the expanding force caused by the outer shell similar to as if the shell was non-expanding.

This restrictive force causes the expansion to fold (warp); hence the manifold of space due to tensors(tension).

.
