hmm,

I dont have to read the whole story,
the first sentence is enough,for now,
constant velocity does not give a time dilation,
so ,it looks to me you are ill informed

You are taking the easy way by reacting on statements that might not be formulated 100% correct when considered in isolation.

However, from the rest of the story is clear that I know and reason from the correct formulation that time delation is the result of relative constant velocity, i.e. I will observe time delation with clocks that have a constant, non-zero velocity, relative to my own velocity. So my formulation is only incomplete at some points.

.
