Some psychologists compare our consciousness with iceberg.
The small visible part of this iceberg is our logical consciousness.
And the unseen (underwater) greater part of the iceberg is
our subconsciousness. Therefore they say, the man uses
only 10% of possibility of his brain.
And if it so, why doesn,t anybody teach us how
to develop our subconsciousness.
I think it is because there are few people who understand
that the processes of subconsciousness are connected
with quantum processes.

Correct – because we have zero evidence it is. Stop reading physics
popularisations that misinform and study the real thing. And if you aren't
willing to do that then what makes you think you are in a position to pass
informed comments?

Bill

The subconsciousness theory
closely united with quantum theory.
These quantum processes which take place in lifeless
(inanimate) nature also take place in our brain.
Our brain can be the laboratory in which we can
test the truth of quantum theory.

=====

1. Nonlinear dynamic process.
2. Vacuum process.
3. Superconductive process.
4. Holographic process.
5. etc.
