In the theory of general relativity, we face the matter of the curve (twist) of the light in the gravity field. As we know, this was proved practically (experimentally) during the eclipse of the sun in 1919 by sir Artor edington. Einstein had proved it with formula in advance and the cause of the curve of the light in the gravity field is explained. I have already explained "the cause of the curve of the light in the gravity field" physically using my hypothesis.
