In the theory of specific relativity, we face the matter that if we throw an object with the same speed of the light

I – The object will be compressed.

II – It's mass will decrease.

III – The time will go by slower for it.

I have already explained these happenings physically using my hypothesis; in another words, I have justified why the object moving with the same speed of the light:

I– Becomes compressed.

II– It's mass decreases.

III– The time goes by slower for it.

New cretin alert.
