according to relativity gringos put gringos onmoon, but  
where are the strongest evidences

The moon's surface, other than obvious protruding rock, is tens of meters deep in extremely soft (lightly compacted) and bone dry soil that's actually still more than a touch salty.

Walking on that dusty surface is not an option unless wearing oversized snowshoes, plus having a really good anti-static solution or applied technology.

I think you faked your trip to the moon and made all of that up.

Don't bother looking to those Kodak moments for any NASA/Apollo supportive evidence because, it just isn't there to behold.
