Vacuum is not the reference, but the medium for photons to travel between atoms.

huh!?

between atom what?

and if in it they travel at that speed, and
not possibly faster, than vacuum is indeed
a reference to all speeds

i suspect you don't know your tensors neither

If you use light to see with, you will not see anything faster than light.
Light will be perceived as the ultimate speed barrier.
If you use sound to see with, you will not see anything faster than sound.
Sound would be the perceived ultimate speed barrier.
Hertzian physics will need to see something beyond light to see faster than light.
