This book was written by a mathematical physicist who was one of that group who got us on the moon.

After Googling Milo Wolff, I ended up at his web site. I was unimpressed with what he posted. It seems as though he is trying to take credit for interpreting the Compton equation as a distance relationship for mass. I know for a fact that people were talking about it way before Dr Wolff got his degrees. Most of his web site has dead links, missing pictures and links to sites that promote the idea that "God is another word for space".

Like I said, I'm not impressed.
