I seriously doubt that Stephen Hawking and his associates base all their scientific theories on information gained by watching the Weather Channel one weekend.

One also sees on some sci-fi shows where the camera zooms out of the solar system, further and further out into space (movie contact, sagan), then eventually pulls back out of the eye of the main character. Can one then, using your logic, assume that the universe is merely a speck in someones eye in another universe?

Geesh..
