Apparently the energy of these hurricanes is 10,000 times that of the Hiroshima bomb or 200 million tonnes of tnt !! – more than humans use in a year .

Since the earth is tilted and the eplipetic revolution means the north is nearer to the sun in summer , the water heats up over the summer and the hurricanes therefore never happen in the southern hemisphere or in spring .

So why not rush otec type contraptions which use the temp difference between the super hot water on top and cold water at the depths , to the hot water areas and trasmit the electricity to the mainland . Clean energy for ever and ever !!!
