so thank you Angelo
yet your possibility of 197Pt to me somehow more abundant in that or
other stage
of history is ... could we say very faint and speculative??
so if we go with the straightforward available data
197 Pt is not the mother of the *main body of Gold'
if yet
do you realise what a good help you were to me ???!!
because if that is the case you helped me to start verify one of my
*unprecedented predictions' !!
anyone who has my book can realise that this is not just an
'out of the blue' prediction' it is obvious there that the basic
skeleton
of Platinum is very different from that of Gold iow
different in obvious details
if you don't believe you can ask those people who got my book
and that is not the only possible prediction
there are there i would say much more meaningful for practical use
in present and for future!!
so thank you again Angelo
maybe we started to do history on live internet
perhaps other people as well are invited to verify or disprove my above
claim
another ps
Angelo you still didn't answer me about your triton Alpha question
that you presented
my question was
what is your question there and
is it unsolved otherwise?

TIA

Y.Porat
