

Dark Matter: Is it just a case of vibrational rates?

I can postulate we all have a soul (5th Dimensional), when we die leaving our shell our Etheric body becomes the main vehicle for a short while vibrating at a slightly higher rate. The mind is where consciousness and personality resides, looking at the brain(hardware) like Einstein's is akin to opening up a computer and trying to work out the operating system & the programs that run (an impossible task) especially when the computer's harddisk as been cleaned.

Here's my theory about Dark Matter:

This material world we perceive is composed of a limited range of vibrational rates, just like only having the ability to tune a radio to one station.

The mass of the universe not perceived is vibrating at different frequencies, these could consist of other planets, suns, galaxies etc.

Other realities co-exist with ours in the way layers work in a paint program. If we designated the material world as a red layer, then the next layer containing orange would perceive the red while the red would be unaware of the orange. Playing God *(12th Dimensional) we could see the whole universe in it's myriad of layers being above space, time & infinity.

* This is only a guess, but look at the way music is structured along an octave of 7 (4th Prime) white notes & 5 (3rd Prime) black notes. Some have speculated in a belief for an infinite number of universes(realities), believing in a God I think the clues are everywhere & an intelligence of that magnitude would not have a spiralling number of realities occuring forever.

If you program a computer you would not let it run riot & God being the programmer of our universe wouldn't either.

.
