Thanks, sounds like great mind fodder.

One of the universal truths I hold is that nature(God) chooses the most simplest method available (conservation of energy). You only have to look at the Fibonacci sequence with the spiral and it's association with the Golden Ratio.

Other clues can be seen with cellular automaton's like the simplest LIFE, following a few rules it displays complex behaviour. Another fantastic insight is the program (BOIDS) that uncovers how birds actually fly.

If God is the architect of our universe, then it would certainly set in place the most simplest methods to attain the best results.

I do have a problem when physicists use over-complicated theories. The Physicists New Clothes with these theories sown in, cherishing their cleverness in understanding to the detriment of further exploration. What happens if another great genius like Newton or Einstein comes along, totally wiping out what was previously held true. Would the physicists community welcome or ridicule?

$E=mc^2$ is one of the simplest equations, but some physicists seem blind to the fact that there could be a God. Einstein didn't come to this planet by accident, being at a place at the right time to overthrow the orthodox is just way to convenient for the future of humanity. Science is just like any religion becoming entrenched in it's own ideology.

I think any genius or great mind on this planet will be open to numerous possibilities, just like a child letting their imagination soar unfettered by the decrees of society and the greater

Re: Dark Matter: Is it just a case of vibrational rates?

establishments. So we all must be like children willing to explore and discover truths that could be at odds with the current beliefs, not being scared to express viewpoints that could incur wrath from others.
