According to Julian Jaynes, a good-sized chunk of our brains used to be used for providing us auditory hallucinations, but, because of the increase in complexity of society, it hasn't been a good way to get ahead for the last 3000 years or so; but the hardware is still there, and sometimes switches on.

>>> PS: What excites me is the possibility of the experience of a particle decay within the human mind that may actually be experienced in sensory way. My thinking is to subject volunteers to particle beam bombardment into their brains to confirm this effect...no joke it could be confirmed at safe levels, subject to minimizing health risks and maxing the sense of the phenomena.

>>> PSS: The 1960's had LSD (chemical), maybe the 2000's will uprate to nuclear (atomic) highs.

>>>

>>> I had a similar experience while waiting at a red light on my back to work after lunch. The light turned green, I rolled forward, the car in front didn't move. I stopped, looked again at the traffic signal and it was still red. To this day I am convinced a neuron fired falsely; I was fully conscious, never drink while working or driving, but that light was seen as green while it was red. Fortunately no accident occurred.

>>>

>>> I have also had the sudden wake up call while dozing off, but I have always put those down to my state of mind at the time. We all have various worries to contend with, such as illness in others.

>>> You may have seen these:

>>>

>>> This a.m. I woke with a nightmare and it took coffee to shake off the horrors and sense of claustrophobia. In my dream a small frog had crept into the hollow rock and stayed long enough to grow too large to pass through the single exit, surviving on whatever insects crawled in. Even writing about it now gives me the shudders.
