If you really are interested, I suggest you filter out from the start any source not linking AI with neural networks.

The only known support of intelligence in nature is the human neocortex (6-layer neural network) on whose structure the pioneers founded the initial research (Ebb, Turing and a few others)

Every example of sustained flight in nature involves flapping wings; that doesn't mean that fixed-wing aircraft are a bad idea. Evolution is a greedy hill climbing algorithm operating in a restricted parameter space. It won't always beat a human engineer.
