So the easiest way to do this, is to use your most accurate conditions, to weight a pure substance and then massage the numbers, until the number of whole atoms in your sample is a whole number. At some point, you will hit on the exact combination of the values of the other factors, and those values can be applied in any other circumstance with precision.

But then you will find oddities like the permeability of free space will show up and things of that nature in other instances but you will recognize it, because you will know what the correct result should be.

.
