Hi T_Puddleduck, You told me:

You invoke cosmology without understanding black body radiation, era of recombination or inflationary theories. You're a JOKE

Black body radiation is the spectrum of a particular temperature as dictated by: $\text{Temperature} = \frac{\text{Energy}}{\text{Plancks_Constant} * \text{Frequency}}$. Do you have any questions about that ?

I pointed out how inflation works: www.Cotse.NET/users/jeffrelf/W.PNG
You failed to do anything other than site irrelevant links.

The era of recombination, what I call the birth of the CMB, contains minute (.001 percent) deviations from 2.7 Kelvin which reveal the " acoustic " harmonics between the baryon-photon traveling sound wave and the dark matter standing wave, thus revealing the size and age of the super-Planck universe. Do you have any questions about that ?

You told me:

Jeff, you're a joke. Please point us to anyone here who thinks otherwise. Your physics knowledge is unrivalled in its shallowness.

I don't expect anyone to understand what I write unless:

1. They've recently studied what I have.
2. They happen to be here.
3. We both have the time and desire to converse about it.

These three things rarely come together, believe me.
(I should be coding right now, instead of goofing off here)

.

I don't expect anyone to understand what I write unless...
