Jan Panteltje wrote:

So, he was wrong about:

Light always moves at c relative to an observer.

Photon as such is not, it is just a mathematical concept, consider a single electron moving between 2 plates, sinewave, 1000 Hz, 1000Hz photon? Bullshit.

Clearly there must be a rather dense medium to 'transport' the vibrations to a remote coil picking up the signal.

As the electron changes speed and at the start of the motion it cannot be know that it will even ******be****** a 1000 Hz wave, clearly the who le photon concept in this context is bull (yes Bilge). He merely misinterpreted Plancks observation of quantisation when electrons changes orbit in an atom exposed to EM radiation.

Gravity wave from black holes orbiting each other cannot exist, as:

1) nothing moves faster then c , so gravity cannot leave these
OR

2) $> c$ is possible, and then ******ALL****** of Einsteins theories hit the dust including gravity waves.

LIGO sees no gravity waves

QED

The list is endless, Einstein tried to replace reality by some dogma 'c'.

He was DOA in the twenties after he got a Nobel for 'photon'.

He could not correct that and lose that Nobel (status).

De Broglie woke him up.

All the Einstein counter intuitive bullshit demonstrates the total lack of clear thinking.

Possibly a genetic defect.

But worse are those poor guys who learn it by head, and then teach the crap to others, and in the process kill the youth clear thinking and un-teach them how to analyse and understand.

Those are the worst, and those are plenty in this Usenet group, always insulting, always evading, always falsifying science, always clinging

Re: Albert Einstein a Jewish anti-scientist

together for mutual insanity re-enforcement.

You, who falsify logic and clear understanding, you are the pitfall of humanity.
You *get* what you preach.

Sounds like jealousy to me. Einstein got it right and you really don't have a clue. When was the last time you proposed something that was shown to be in such agreement with observation?
