Hi Randy_Poe, You post via Google because you're not computer literate.
No matter where I go, no matter what PC/LAN I use,
my _Virtual_ ISP (Cotse.NET, 6 dollars per month) goes with me.

Coste lets me break out of firewalls (by tunneling out to Coste's proxies),
send emails (i.e. SMTP_Auth... normal ISPs don't allow this),
block anyone who sends me email (by trashing the alias that I assigned them),
and it FTP hosts 150 megs of private (no crawlers allowed), ad-free files.

Speaking of my hand-rolled newsreader (X.EXE), you told me:

It can't quote. That seems to be a fundamental problem.

You (Randy_Poe) can't quote, you can't restate,
nor can you understand what you've read (e.g. T.J. baffles you).
So you'll never learn about foreign-language billionaire " admirals ".

You told me:

Because I plug in from different places,
I choose to use a uniform web-based interface.

Why not use your own NNTP client (written by you, in C/C++) instead ?
Google is a crappy interface, with a crappy editor,
much worse than MSN_TV2 (Web_TV), running Win_CE on an Intel box.

I told you:

T.J. is at sea, so he has to use GlobalStar (it's like a cell phone).

And you replied, " No, he's using Web_TV. "

You've no clue what Web_TV (MSN_TV2) is.
It's a dial-up (or broadband) ISP.
Some clients run Win_CE on an Intel box,
so you could have any fucking monitor you wanted (not just a TV).
(Besides, T.J.'s TVs are high-res, HDTV, 1,920 x 1,080 pixels)

Web_TV clients can connect to LANs, and run the most current version of

Some Web_TV clients run Win_CE on an Intel box.

FireFox, Adobe Reader, Windows Media Player, etc. For more details, see:

Wikipedia.ORG/wiki/MSN_TV
