

How to split (or combine) magnetic force?

Source: <http://sci.tech-archive.net/Archive/sci.physics/2006-12/msg01121.html>

There's a science quiz with the following question:

With a bar-magnet you can lift 1 kilo of steel.
Then you split the magnet in two exact halves.
How much can you lift at best with each of the two smaller bars?

- A. about 1 kilo
- B. about 3/4 of a kilo
- C. a bit more than 1/2 a kilo

I searched the internet for a good explanation, but without success.
I found webpages that mentioned that you cannot simply add (or split) these forces.
I also found lots of formulas but I don't know how to apply them on this situation.

Anyone can give me a hand?

Bert
