Some comments.

1.

I use 100% of my brain.

2.

Wow

Subconsciousness and quantum physics? Great imagination , but false.

Subconsciousness is not something developed , its something you can find

, which is yet floated up to your consciousness.

For example you do not like the girl whose voice is high tone

..you donot know why . Its because your mother has quite often yelled at you.

Developing brain is nothing to do with subconsciousness.

Psychologist use this term mainly to explain our hidden desire , trauma or scar or hope.

3.

Thank you so much Socrates for starting of this most thought provoking thread, I agree we are taught virtually nothing regard the subconscious, and psychologists seem to understand little of its inner workings.

I think too, that you have made an interesting connection between the subconscious and that of the quantum theory.

4.

What if everything was happening inside of you and through taught beliefs people only thought they were separate, thus no more dualism

5.

There's a little misunderstanding here.

That we use only about 10% of our brain is true, but we can't 'train' ourselves to use the remaining part.

It is, in fact, the evolutionary process.

Perhaps tenth generation from our time will start using on average 12% brain, and perhaps after a million years

(if human race is still surviving), will the homo-sapiens will be able to use almost 100% of brain.

6.

Interesting concept.

Re: Subconsciousness and Quantum theory. Is it possible?

Question does your consciousness give you intuition...
or does your intuition give you conscious?

7.

Hmm. Finding similarities between the subconscious and quantum theory could take you interesting places. But there's a much easier way to "develop" the subconscious mind. It's called learning to be critical, or thinking about how you think, or becoming conscious of how subconscious processes (stereotypes, preconceptions, personal and interpersonal experiences, emotions, memories) affect the conscious ones.

8.

I think there's a clearer philosophical–historical answer to this: the Western tradition is to consider the human being as a divided being: mind–body; soul–spirit; analysis–synthesis; conscious–unconscious; left brain–right brain. This notion comes from Ancient Greece: greeks thought that there were several "souls", each one accountable for a part of human behavior. Centuries later, Rene Descartes strongly

influenced our current thought with his mind–body dualistic theory. It survives to this day. Anyone who has seen cerebral blood flow images of the brain knows that the 10% myth is just that: a myth – we use all of our brain – it wouldn't make evolutionary sense to waste 90% of the brain if we could go by with only 10%. Of course, this 100% can be used in different ways and that's what makes everybody unique.

The nervous system is no different from any other matter – so quantum theory holds true in its constituent elements.

9.

Ha ha – interesting concept but I don't think the world is ready for this yet.

10.

sounds fascinating.....im gonna get on that right away!

11.

There is also a theory that people can communicate subconsciously on a genetic level, but only in an extra dimensional manner, by way of "junk DNA." Do you think there could be a connection? I believe anything is possible until proven otherwise.

12.

I too have thought about it. You can read about Einstein–Podolsky–Rosen paradox and Bell's theorem in quantum physics for deeper insights. Its difficult to apply those to the neuronal transmission. Do discuss with me.....

13.

would it be that dualism exist in human mind only, considering that consciousness is not a mind? Nobody knows non dualistic perceptions , just guessing.. ..Seems to me that intuition is not dual at all...and not linear, would be considered superconductive. Holographic? perhaps. Why not? and definitely perceived by brain but not of it,

Re: Subconsciousness and Quantum theory. Is it possible?

perhaps not even of a mind...Now, quantum physic would explain some mystery of consciousness much closer than mind and brain... ..

If Cause is understood effects will be....

Study effects does not explain cause at all but creates ongoing divisions represented by "dualism".

Cause and effect is also representation of duality....

Cause only in not dual...Would it be that spontaneous manifestation of intuition is evidence of awareness which is not dual too, thus very a little known?
