

A few silly questions

Hello folks,

I'm engaging in discussion with someone and have found myself going around in circles, so I'd appreciate some help with a few mundane questions:

Can velocity change without time?

Can acceleration take place without time?

Is there such a thing as instant acceleration?

Can momentum change without time?

Can anything change without time?

Is this statement true: "But when no distance is covered against or with the force, no work is done and energy is neither stored nor expended."?

Thanks for your time.
