Scherk and Schwarz have gravity's forces the greatest force in this tiny realm. They have the force in tons as a thousand million million million million million million million tons.(1 with 39 zeros after it) In an area this tiny A thousand million million million million million of a centimeter. It is no wonder I have a theory nature in the beginning had just the gravity force and the other three forces are faces of it.
Bert

how dose gravity describe the strong nuclear force. The force of two nuclei repelling one another?
