Hi.

Why say that free energy is impossible? We do not know everything, and we should never pretend to. Free energy may still be possible, it's just that nobody has found out how to do it yet.

Of course it's possible. And you are **perfectly** entitled to expend any and all resources available to you to demonstrate that it's possible.

However, if you want to conscript or recruit **others** to the effort, then you're going to have to demonstrate that the risk is worth it. Presently, the patent office has taken the position that any application that involves violation of the rule of energy conservation is not worth the risk of assigning personnel resources to it.

And I'm supposed to get all this proof *_myself_*? Few if any research projects can be done on one's own.

Re: Free energy???

What "risk" are you referring to? You mean, because the scientific community ridicules them so much? And I did not say anything about patents, I was talking about simply searching for free energy, not about patenting/selling anything.

What I am trying to say is that science can never pretend to have all the answers, this is a fundamental precept. Therefore we should be free to question absolutely every doctrine, every theory, every experiment, search for any evidence for/against any claim, etc. Questions are of the utmost importance in science, and without them there can be no scientific progress.
