Cohen There are more universes in the cosmos than flakes of snow in an endless storm, and they are exactly alike down to their number of electrons. Our parallel universe is positive. It is only a membrane away. My mirror image Terb tells me he is older than me by less than a second, and it was in this short time lapse that kept our universes from touching. (destroying each other) It's not possible for nature to create other than pairs, and universes is the easiest things for nature to create. Through out the universe Strings, Relativity, and QM laws are exactly the same. There is only one cosmos, and that means all things fit within it are the same. bert
