Present atomic physics was built based on completely unscientific fraudulent postulations such as:

1. Atomic orbital electron performs a planetary motion around its nucleus, a postulation disregarding the fact that atom does not exist lonely as a single body, and its orbital electron is unable to keep its planetary motion due to interruptive electromagnetic force given out from its neighboring other element particles.

It's convenient then that atomic physics doesn't make this prediction...

2. Electron is unable to move without inducing magnetism in perpendicular to its moving path. Nevertheless, present atomic model does not account this magnetism to be added to the centrifugal force of orbital electron in balancing to its nuclear Coulomb attraction, since this magnetism acts to straighten linearly its circular orbit. J.J Thomson neglected this magnetism in measuring  $e/m$  value, so the present mass of electron was greatly overestimated one.

I believe you can correct for this if you wanted to. I don't know what effect off the top of my head it would have on *\*measuring\**  $e/m$ .

3. It is a basic postulation one proton can attract one electron in the present atomic model. Nevertheless, a proton can attract 92 electrons if it joins in to a uranium nucleus, so the gross Coulomb attraction between its nucleus and its 92 orbital electrons turns out to be  $92^2 = 8464$  in average, according to the Coulomb law. This self-contradiction of Coulomb law found in current atomic physics is due to its simple imitation of Newton's gravitation law.

I'm not sure what you mean here. A single proton can attract an

Re: Present atomic physics is built based on a large number of fraudulent postulations

Re: Present atomic physics is built based on a large number of fraudulent postulations infinite number of electrons. It has nothing to do with gravity.

4. There does not exist a discontinuous motion of mass particle in the space of nature, because discontinuous motion of a mass particle in scientific sense means that it disappears instantly at a place and then reappears at another place. However, present atomic model h
