Well, most people claiming to be scientists generally take the view that life is mechanical, higher dimensions do not exist, and that when the brain dies all consciousness also dies. The problem is that there is data all over the place indicating that such is in no way true. Consistency in near-death experiences, ghosts, seances, channelings and all the rest surely indicate that SOMETHING is going on. It's all way too consistent to be so easily dismissed with a wave of the hand as "imaginary" or non-existent. Yet, most of science does this. You know damn well that this very conversation we have to have here on the crank-filled internet would NEVER be allowed to take place in any respectable scientific forum!

Well. Let me first answer this last paragraph of yours. Our conversation is lot saner than say the physicists Many worlds interpretation or wheeler advanced-retarded waves that travel back and forth in time or superstrings almost infinite vacuum landscape. So in a way, they are the real crackpots.. lol...

Anyway. We must really understand the physics of ghosts, spirits and ESP. It has to do with the marriage of quantum mechanics and general relativity (quantum gravity or quantum spacetime). Objects (quantum) interact with spacetime (GR) that's why quantum gravity is involved. So long as we can't figure out quantum gravity, we won't know the physics of ghosts or ESP. Don't agree?

Our brain is enough to cause consciousness. Cats have consciousness. Humans also. But from cognitive & PET functional neuroscience,

Re: Ghost Hunting & Physics

the brain is a calculating supercomputer and you learn language and math by pure neurons and biochemistry. Put lesions or remove the part and you lose the ability. Even memory is caused by neurons. In other words, the brain appears to be sufficient for the lower mind enough to function in this world. Now there appears to be another mind (a higher mind) that locks into the brain. In other words, co-evolution. This appears to be the case based on experience. Those with very developed higher mind can remember past lives, etc. and I met a number of them. But without the higher mind, the brain itself appears to be sufficient to function and think. Refute this!

Why should I refute it? I pretty much agree with it. The only question here is the fine point of exactly HOW MUCH the brain alone can function and think. My view is that it would be at the severely retarded level or basic animal actions level.

This is what I've been trying to figure out lately. I've been researching deeply into neuroscience as it can offer us a clue. Hence quantum gravity and neuroscience is the basic we must explore if we want to understand anything about ghosts or ESP and related stuff.

You know what. Years ago. I loved to use the term etheric body. But this term was a medieval one pre-relativity. So we need to make it compatible with SR and need to use another term such as spacetime conscious sub-manifold, etc.

A rose by any other name would smell as sweet!

When a person dies, the lower mind dies. Being dead is like being stuck in a dream that you can't wake up. This is the impression I got from corresponding with those who deal with the dead.

Um yes, but it depends strongly upon the emotional attachment to 3-D earth reality. If there is strong attachment basically you remain in the same place you were only somehow you can interact with things and people don't see "you" and can't hear what "you" say. It's very frustrating and confusing to "them".

I think it's like this. When you are sleep. Your frontal cortex is

Re: Ghost Hunting & Physics

suspended and the emotional and other modules in your brain can't integrate everything. They are fragmented. This is why dreams don't have sequence and sometimes don't have logic. Now in death. What happens is that the emotional part has independent action so that it can be in the place it is attached to without any thinking component present! Get this? Let's focus on this part before going to deeper waters. Let's master the basic first. Our limbic system is connected to a morphogenetic field in the body which is the physical correlate of the brain emotional part which survives after dead. What do you think?

Will discuss the rest after we agree on some basic.

kows

4. Dead people are not suddenly smarter or more knowledgeable than they were when they were alive.

Of course. Unless if they are saints or very spiritual developed people. These are the only people who can still think after dead.

Simply not true. A CAT or DOG can "think" after it is dead. Go think again about your "higher mind" statements above.

5. Dead people are no more trustworthy either (your dead grandfather speaking at the seance may not actually be him.

It's like this. Just like in the physical world which evolve insects, rats, and other creatures. Pure quantum creatures or insects can also exist in the pure hilbert space, so most of the shells (spacetime sub-manifold) left by dead people is taken over by this quantum insects and this can use the memory of the manifold to speak at seance.

Um, yes. This can and does happen. However, it's not "quantum creatures" taking over "shells" but low humans or "demons". Those speaking at a seance are FAR from trustworthy as being who they say they are EVEN if they are dead humans.

6. Generally when people die they gravitate to places in higher

Re: Ghost Hunting & Physics

dimensions that most match their thoughts unless special circumstances interfere.

When a person dies, only the higher abstract side of him survive.

This

is the reason why the more spiritually developed a person is, the more side of him survives. If there is sufficient of it and it reaches a threshold,

then the person is literally still alive after dead because through the higher abstract nature, a second brain can be produced by the higher dimensions or spacetime.

Yes, only the "threshold" known as the "level of permanence" is far lower than you suppose. Generally organisms like carrots or bees return to the "sea of spirit" when killed. But almost all mammals are beyond the level of permanence and have an integrated abstract side that survives more or less representative of the form held when in the body.

7. If a person dies so suddenly that they don't know they are dead they may hang around where they died because they can't figure out how to get out of there. That is a Ghost.

No. Most of the time, these ghosts are just shells composing of memory. There is no will in them. These shells are composed of bohmian wave functions or other standing waves that survives after dead.

I won't argue and can't speak to "most of the time". yes shells do exist and can survive, but generally in a true "haunting" the entity doing the haunting has FAR more energy and is not simply a memory shell. It is the higher abstract portion which is energizing old patterns because of some emotional attachment or drive. That is what attaches the entity to the given location which creates the so-called "haunting". LOTS of people have investigated these events.

8. If a person is killed under extremely emotional circumstances or where they have a very strong WILL to fight against death, again the strong emotion binds them to the place of the violence and they become

Re: Ghost Hunting & Physics

"ghosts" that "haunt" it.

Again, the ghosts created this way do it automatically. Ghosts normally don't have will. Unless they are possessed by quantum animals or unless the ghosts is spiritually advanced. In which case, it can survive after dead.

I don't agree. You are placing the "level of permanence" MUCH too high!

There is much more but that is enough for now. There is much work already done in this area. See the great books by Hans Holzer.

My knowledge of the above came from experience and corresponding with those who deals with them directly including direct pupils of the immortals who live after dead.

EVERYBODY beyond the "level of permanence" lives after "death"! But you already know this kind of information can't be trusted without experimental and other confirmation! I don't care what "immortal" the source claims to be. As I said there has been a LOT of investigation into this sort of thing for many years. Quite a bit has been observed.

Of course I'd be happy to be proven wrong in what I'm saying. I'm only interested in the truth, wherever it will take me. Likewise, if mind is pure brain and there is nothing else, it's fine (but this is the not the case after decades of experience and study).
