To have been a failure, the M-M experiment is considered by many to be the greatest scientific experiment of all time. Such is because the explanations of Lorentz and FitzGerald that "all matter contracts in the direction of motion" became the basis for Einstein's theories of relativity.

But what if matter doesn't contract in the direction of motion?
Of course those men, and Einstein, would be wrong.

According to SR, the 'explanation' for the MMX null result is extremely simple: the speed of light is isotropic, and nothing is contracting. So the orientation of the interferometer doesn't affect the interference pattern.

According to SR, matter doesn't contract.

Dear Paul: As a new visitor to my posts, thanks for replying. For the past year I have been answering your same questions, though posed by others. Reluctantly, I must tell you that I can't customize replies "from square one" just for you. I simply don't have the time. But I will reply to you if you will comment, later, after reading some, or most of my earlier posts. Those should answer the majority of your questions. Thanks again. -- NoEinstein --
