| I know they can't perform work but I am puzzled.
| I have 2-100 pound pull magnets. They are in repel mode.
| The top magnet is mounted on a round one inch thick steel plate inside of a
| PVC tube. The other magnet rests at the bottom of the tube. So far it
| suspends 50 pounds about 3 inches in the air. If I try and hold 50 pounds
| against gravity I become a little tired. This suggests I am expelling
energy.

Rest it on a shelf and save yourself getting tired.
Pumping blood into your muscles (in which a chemical reaction is
taking place, releasing heat) is making you tired. This suggests you
are wrong.

| Is the pair of magnets not doing the same thing?

The magnet is not getting tired, it releases no heat.
