The problem to create artificial diamonds was keeping
chemists busy
for long time but all efforts failed because there could not be
found
a solvent for carbon up to now (1888). Only recently
Ballantyne
Hannay of Glasgow achieved that goal by heating carbon

Re: Diamond question

together with
magnesium in presence of a stable nitrogen compound under
very high
pressure. The precipitating carbon takes the diamond
structure.

So far so good. Will that information help Uncle Al?

[snip more jabber]

Of course not. hanson is the confluence of overwhelming ignorance
with overweening arrogance.

Devil Solvent is veery interesting now that it is housebroken.
Nothing industrially interesting as yet. When we go from a wire to a
plate its

http://www.mazepath.com/uncleal/c_four.mp3

Disorder is a pisser. If it can grow a little it can grow a lot.
Gotta reason with it.

Uncle
some information that i found as a by product of my research
about structure of matter
the diamond latixce unit is composed of
5 Atoms of Carbon !!!!!

Re: Diamond question

if you have to soot --- shoot!!
dont talk so much and high and complicated as you do

What AI has is called an "education". The words he uses shouldn't be difficult for someone who reads once in awhile.

because lofty language does not
always impress **all* people
shoot i mean
go do your project of giant diamonds
and only then ststart talking highly about it
anyway you know
sometimes you are looking for something
and ass a byproduct find another (may be not least
important!)
as you know from our old Bible
king Saul was a shapherd and was looking for his lost donkeys--
and found his crown of a king !!(:-)
