so far ..all the busted blades ive seen they busted when they biult them and installed them busted.

welding aluminum at room temp might not cut the pice off at the weld untill harmonics or cold or heat cant jump the bust.

Thie aluminum blades nead to be cold when they get welded. You dont in reality weld aluminum together ,,you cut the pice off where you welded it and its not one pice any more .

aluminum dont bend it gets crushed .

Get it cold enouph you can weld alu to be one pice . but you cant weld alu at room temp and have one pice .

get it down to -10 F and you might weld 1/4 inch and have 1 pice .

Then harmonics on thier bades needs a band welded around the blade like a ring .one at 20 feet another 30 feet and the last at 15 feet.

So no demper is the same distance apart so no waves can jump the bands from end to end.

.
