I was trying to figure out the cause to relativity. And the absolute outcome was a profound principle.

We are everywhere acting as if time was a mirror. Each interaction can be basically thought of as if a mirror was present to alter interaction itself.

Here is the basic cause of relativity.

Principle One:

"For every action there is an associated act of time symmetric action."

Each and every interaction then causes relativity to be expressed as a distortion of all interaction. Time symmetric action appears the outcome of each and every action.

Who knows what time symmetric action is?

Douglas Eagleson

A hint.

A basic diagram is given:

! < !
^

The angle of time symmetric action with respect to the original action is always either a right angle or time symmetric dependent.

Suppose this was a true principle.

What would happen?
