- 

I've just received a few pics of a small rocket motor, from a friend of mine.

It's about 2Kg and about 45cm long with a 10cm wide nozzle. It's a liquid fuel motor and doesn't look like it has any electrical connections.

We're all guessing it could be some form of reaction nozzle for (maybe) a Gemini or Apollo capsule.

I've posted pics to alt.binaries.pictures.aviation

I'd appreciate any advice on the subject.
