I must say, though, that after years of reading descriptions of the Saturn V that were chock full of superlatives, when I finally saw the hardware with my own eyes I was impressed not by how large it was but by how **small**. That is, by the fact that something just a few times the size of a large truck could go all the way to the Moon and back.

....Part of the problem in the size (mis)perception is that the two stacks you can get close to are lying on the ground. Standing upright, the immensity is more apparent.
