The Moon's a lousy place to park your nuke bomb missiles

Nukes are old technology, they should be banned.

Yes, but how do you enforce that ban? As it is, the USA is the only nuke owner that ever actually used any "in anger", as they say in the military. Way back a hundred or so years, the guy who invented TNT or was it dynamite, Mr. Nobel (the guy who set up the Nobel peace prizes) thought that such high explosives would make war too fearsome to do anymore. Turns out he was off by an order of magnitude or 2. So far, after WW2 and the USA nuking those two Japanese cities, nobody ever dropped any more nuke bombs.

They would have if they could have, and today there's a good dozen such nuke capable alternatives from which those and much worse dirty atomic bombs could get deployed, not to mention what good a little semitic engineered VX couldn't finish off.

Today, what's worrisome is some place like Iran developing their own nuke bombs, and their leadership may become crazy enough to actually use them.

You mean that our resident LLPOF warlord(GW Bush) and his faith–based

Re: ..New Space–Race to the Moon..History is (Tragically) Repeating Itself

partners in crimes against humanity could provoke them into defending themselves.

At least the Russians and Chinese, and even the Indians and Pakastanians(sp) understand would would happen if they dropped any nukes, and none of them really wanted that to happen.

But with some faith–based efforts that would make those crazy Zion Yids into happy campers, by all means they could be provoked into using them. In which case we'd have to return the favor with all the love and affection of those almighty atomic bombs that we could muster, and we've got way more than our fair share of those bad boys in our inventory, possibly even enough to take on the whole anti–semitic world.
