With many(thousands?) of expensive and polluting launches required

Expensive, none. Since it's not cost effective. When launch costs start to drop we'll see more talk.

As for polluting, moving to something like a LH2/LOX launcher solves most of that problem (but not all).

And is it really that big a problem even if it is RP1(?)/LOX. Apart from maint, those are a one time thing, not like the recurring release of carbon et al from running a conventional power plant.

portable adj, code that compiles under more than one compiler
these opinions are mine, all mine; HP might not want them anyway... :)
feel free to post, OR email to rick.jones2@hp.com but NOT BOTH...
