Such a shame we ended with Apollo 17, in terms of science we were starting to really hit our stride.

There was still the problem regarding where they thought it was safe to land the LM; the "Bonestell landscape" parts of the Moon looked iffy from the viewpoint of landing safely, but would have been very interesting to explore.

Boy, if they could have landed one near a lava tube and let the astronauts go into that, it would have looked spectacular on TV.

As a caver, exploring some of the lava tubes on the Moon would be both fascinating and scary.
