An interesting suggestion.

First, of course, you have to raise employee benefits and job security for the manufacturing and launch crews to those found in Europe. The lower standards of the US give it a shocking unfair advantage. :-) This won't be popular with the companies, mind you.

Then you have to lower safety standards to those of the Chinese. This may not be popular in some quarters.

Then invest in factory automation and streamlined launch procedures to match the Russians. This is going to really annoy all the people who get fired as a result, but it will indeed reduce costs a whole bunch. (Resolving the conflict between this and item #1 is left as an exercise for the reader.)

There are reasons other than subsidies why launch prices differ...
