Brad Guth wrote:

First of all, the vast majority of ETs have to be of the friendly sort, if not the intelligent design (AKA creator) types because, if they'd wanted to nail our sorry butts of such pagan bigotry, arrogance and greed that based upon so freaking much LLPOF-ology, that task certainly would have transpired long ago, or otherwise at any time you'd care to suggest.

Actually I believe that most ET's are of the fairly hostile sort. They didn't get to be #1 in their Food Chain by being 'nice guys'. They ate the ones beneath them to survive -- same as us.

But they do suffer from the same problems we do and have the same hopes and aspirations for the most part.

The reason they haven't nailed "our sorry butts" is only because the USAF has used every dirty low down trick they can think of to keep ET 'off balance'. And, I suspect, the CIA assisted as much as possible. Don't ask for details.

Personally, I think most ETs have had a somewhat weird/perverted if not a little sadistic sense of humor. Of course, if you'd been commuting interstellar or even local interplanetary space, you'd think that having a little sense of humor might be essential.

Yes, ETs do -- I suspect -- have a "somewhat weird/perverted . . . sadistic sense of humor." And, I agree that venturers into Outer Space need a "little sense of humor" to survive.

Now, perhaps, you can understand why I strongly recommend the immediate increase in USAF's budget of 50 billion dollars a year, each year,

Re: LSAM

until the USAF budget reaches 400 billion dollars a year. This is not a joke. We are asking them to defend the U.S. against all enemies both foreign and domestic. And, ETs are on the list. Defending the U.S. against ET requires mega amounts of money. But, it is possible because of America's extremely high level of technology.

George Carlin's "WHEN WILL JESUS BRING THE PORK CHOPS" is exactly what we all need to go by as our koran.

What our USAF and of others encharge of keeping the perpetrated cold-war at or near WW-III status quo for the past several decades (ever since the end of WW-II) isn't exactly what I'd call being all that beneficial, whereas what we should obviously have been doing is communicating our best intentions of working with such ETs, and of otherwise doing our best to learn from and thereby working under their obvious expertise of what such ETs represent, at least for that of our having appreciated their having been the intelligent folks that managed to establish and sustain whatever their task was on Venus, that was obviously in spite of the environment being so geothermally hot and nasty.

Yes, the ETs are intelligent. They have to be to build starships, much less the Interplanetary ships that we are 'dreaming' of. And we need to treat ET as we treat other Nation States here on Earth, using our State Department, not the CIA.

If Venus is truly so "hot and nasty" then life on Venus may have come from another place, possibly another solar system. That means they may be 'quite' advanced.

There's no need to shoot first and ask questions later (aka Dick Cheney style of quail hunting, or GW Bush LLPOF style of his WMD snipe hunting).

Remember that I's said life was technically possible on Venus, though I'd qualified such as per any halfwit ET village idiot worth their salt knows damn good and well, that some degree of applied technology would get involved if such folks were human like visitors.

After viewing you pictures of Venus I believe that it may be possible life exists on the Venusian mountains. Venus has very high mountains that put a fair amount of land above the extreme pressure of it's atmosphere and possibly above much of it's extreme temperature as well.

Re: LSAM

Re: LSAM

Did you manage to get a good look—see at the Videos produced by David Sereda?

Would you care to honestly discuss/argue such topics, or better yet as to focus upon a specific topic of ETs or even that of Venusian evolution sustained life on Venus?

Please give URLs for David Sereda. I haven't seen them.

The most important thing for most folks to realize is that places uninhabitable by Earth Humans may be very comfortable for life that evolved in that particular Alien environment. I suspect that Martians may be able to breathe carbon dioxide, separating out the carbon from the oxygen in lungs that differ somewhat from ours.

Also, in the case of Mars, Martians in my crops of the JPL photos appear significantly smaller in size than ourselves. If food is in short supply this would explain their small size. There is a picture of a three toed Martian 'cat' that looks about 2 inches in length. You have to see the original JPL picture to realize the approximate size of the creature.

See: <http://stardot.blogspot.com/>

So, Aliens may differ from us and be able to survive under harsh conditions like Venus and Mars, as well as other planets. Also, Aliens with advanced technology may be able to inhabit planets that would not be capable of supporting life at all. A lot of such technological adaptation would simply require a good energy source, such as nuclear power.

Overall, I would like to point out that "an ounce of prevention is worth a pound of cure" so we should immediately begin the strong support of the USAF because they are tasked with protecting the U.S. from all aerospace threats.
