W. Mook is correct in his assertion that using the Lorentz force without taking into account the stress energy tensor is "ludicrous", yet I wouldn't want to discredit the intent of the post by discrediting the inventor's "working models" as an "example" of "fuelless" technology. It is truly a revolutionary concept that causes us to think about the energy dependency and international manipulation taking place, whose proponents wish to **dictate** energy policy to the **world**.

We are dealing here with the gap between the theoretical and experimental methods. The 'theoretical' often has to catch up to the 'experimental'. Electrogravitic works. It has been proven to work.

International governments are **hot on the heels** of any type of this technology making it into the mainstream. Why? Because this type of technology would replace our **antiquated** highway civilizations with **flying cars** rather than **gas guzzlers**. My question is this: If the technology that steers the most modern form of automobile that we have on the planet cannot adapt to this revolutionary technology, then what good is a college education going to do for anybody? What good can any society do for anybody? Will the energy establishments always be interested only in boxing out manipulative technologies for **earth bound** colonies?

Re: Electrogravitics is Reality!

The "energy establishments" are looking at tabulated money figures, profit and loss statements. They are interested in satisfying stockholders, not the countries or populations of those countries. Because of this they are sometimes the opponents of technology change.

Ah, but here is the catch: Technology should always be from the *top down*, but what is the *top down* if those entities *with the power* would never speak to us until now? Will the *bottom up* always be the *initiator* of *top down* incrementalism? As I have stated in an earlier post, "What Would NASA do with (298 million)(30 Pieces of Silver)? because if Populism wins elections, so would the upwardly (and outwardly) mobile win employment in a quantum energized economy!"

A "quantum energized" economy should produce so much material wealth that transitional change would amount to pennies compared to it's benefits. Holding back on technology that works, for either theoretical or economic reasons, doesn't make sense.

Tomcat told me to watch out for the "green glow", and I think he was right on point with his assertion, but also in addition to *black projects* that are already using this technology! Ever heard of area 51? Well, we're still waiting to escape from our dependency on foreign oil and domestic environmentalism! If no one can help us, then, by God, we'll do it ourselves!

The oil problem is dominated by the corporations that have an enormous investment in distributing and selling oil products. The quantity of energy needed to run our society, however, has gone beyond what a diminishing supply of world oil can provide. This 'fact' is the driving force behind rapidly increasing prices for gasoline, not simply Middle East politics. It is time for change. Changing to He-3 and hydrogen energy makes a lot of sense, as well as other alternative energy sources.

Re: Electrogravitics is Reality!

"It's time to change Derbies for Stetsons and kick some mule butt!"

When it comes to energy, yes, it is time for change. And, electrogravitics should be added to our aircraft immediately.

Yes, Mr. Mook, the stress energy tensor can tell us how to perform "teleportation" rather than subluminal "transportation", so now the question comes down to "who wants to go versus who wants to stay?" (We'll leave that to those "earthlings" who have already decided that we didn't evolve here, but were a *genetic experiment* of sorts, and may or may not wish to return to the other *star*. Yeah, its really a spiritual battle between the "forces of darkness" (stay underground during the next pole shift?) and the forces of light (let's get out of here, –an exercise in blood resonance that dripped on the mercy seat!).

It is difficult to explain why there are humanoids on Mars. See: <http://stardot.blogspot.com/>

Can we "press on" until that day by changing our financial dependency to independence by mining the asteroids? Ask on, because after 7 years on the internet under the heading "Asteroid Mining Technology" (at the top of the google search engine), I have received no more than about 5 really, truly interested people, all of which I have never heard from again (because, I think the issue here, really, is the affordability of earth-to-orbit nuclear pulse technology) as Mr. Mook has so eloquently ascertained in his posts. Yet no one really *important* in the energy industry has recognized that there is a type of *non-lethal* nuclear pulse technology that would shrink the EMP area to under 50 miles! It's surprising to me that *somebody like* Elon Musk isn't on top of this technology!

Re: Electrogravitics is Reality!

Moons and asteroids are loaded with resources for a highly industrial economy. He-3, at 3 billion dollars a ton, is the first resource valuable enough to immediately justify the expense of rocketships.

Why not forget earth-to-orbit nuclear pulse propulsion technology and just *teleport* off the planet?, one might ask. Maybe because all that would be left are a conglomerate of international bankers with empty pockets, ready for Armageddon, or perhaps the self-absorbed adults who'd rather be *entertained* by the swill of junk on the airwaves, or maybe those whose *fire by night and smoke by day is someone else's fall from grace at the altar of legalism*. Whatever they might decide is completely irrelevant to what is being done, at least in spirit, and at most in *real technology*

We have the technology today to build a waverider capable of escape velocity. The use of Thiokol SRBs as RATO (Rocket Assisted Take Off) units and 'electrogravitic' to smooth airflow and increase thrust are a couple of things that might make the transition to Outer Space a ten year goal, not a century long ordeal.
