Wow, I'm impressed, I guess it's Mr Mook...

Willie.Mookie@xxxxxxxx wrote:

Two projects were funded. As was disclosed in the press release. A \$6.5 billion project in Sumatra that produces 200,000 b/d of gasoline when completed and which I retain 35% ownership interest. Another in Boreno that also produces 200,000 b/d – which I retain no interest – but am paid \$7.5 billion for I believe I sent you a description of those projects and photos of the sites..

Since then I have signed a deal in Australia to produce fresh water there from sunlight and sewerage and I am negotiating a deal in UAE to upgrade residual oil to gasoline adding \$30 per barrel using solar hydrogen. The size and financing of these projects have not yet been released.

Here's an example, I invented a color changing golf ball. Sent some samples to the NYT and other sports editors around the country, sold over \$500,000 the first 30 days – and signed contracts with buyers at stores all over the US and Canada. I only made a handful by hand – haha – got a patent – and sent out a press release.

Sounds simple.

I got deposits from folks, put it in an escrow account, arranged financing, and constructed a machine to build balls, and negotiated with Dunlop in North Carolina to have the machine operate in line. Worked with a fulfillment house in Chicago to fulfill orders – and deposit checks with my bank.

I basically got a check from the fulfillment house every week, and a

Re: Village in a box

report from the manufacturer every week, checked one against the other, was available to handle any difficulties that cropped up – and made about \$300,000 a month for about 8 months. At the end of that period, sales started to falter, which is typical of golf aids, and I sold the entire operation to a Golf specialty company. We signed the deal, I took the file folder with all the accounts out of my filing cabinet, and mailed it to them, and received a wire transfer into my account.

It was the easiest 3 million dollars I ever made.

Spin communicating ball

Abstract

This invention relates to a spin communicating ball. Communication is achieved by coloring various sections of the surface of the ball with different colors that mix and form new colors when the ball is spun. Preferably, the colored sections are three mutually perpendicular great circles and, preferably, the different colors are the primary colors, red, blue, and yellow. For a golfer, the intersections of the great circles can be used as a focus spot in hitting the ball. Individual great circles can be used to align the ball with the target and the golfer with the ball and also as an aide in putting

After all, newsmen exist to write newspaper articles – and if they spend a half day interviewing someone and doing the leg work to check them out – they sure as hell will write SOMETHING! and they did. But their editors decided not to run it – not even suggest to drop this or accentuate that. Just drop it. At TWO newspapers. I will tell you, if a newsperson spends a day talking and a week researching and ultimately writes an article – they will not give up a story lightly. And if it was me, I will tell you, they'd call me and give me an earful! haha. But that didn't

Re: Village in a box

happen.

It just disappeared into the vast memory slot and was gone.

Your "It just disappeared" is suggesting of your having one such press release. Was anything ever published by other than yourself.

Look, you send press released through public relation firms to newspapers. I signed a deal in Jakarta with a coal company and fuel marketer. We had a press conference in Jakarta to announce it. I was on the evening news, and my picture was in the paper. A great magazine article appeared that week end by Eko Edhi Caroko – a popular and respected journalist – five page color layout – August 21–26 Trust Magazine. Also Economic Review June 2007

I've got this Washer/Dryer concept I've been playing with for quite some time. A single machine that uses half the energy of a conventional Washer/Dryer, dual cycle, simply put your dirty clothes in push a button and come back some time later and hang up your now washed and dried clothes.

It's a really "green" washing machine from an energy standpoint.

Is it really that simple?

Do you do any mentoring?
