In about 10 years the next generation of 'intelligent robotic explorers' ought to be operational, i.e. those who will be about as intelligent as insects.

Perhaps in 30 – 40 years intelligent robots may have advanced up to the intelligence of a dog, perhaps.

Perhaps pryor to the end of this century we will see robots approaching our intellect.

Einar

Your naysayism and profound denial of being forever in denial is noted. Not bad for a pretend atheist rabbi like yourself.

BTW, being as smart as a Einstein human in space isn't exactly good news if your frail DNA is becoming summarily quite dead or badly dying off because of gamma and hard-X-ray dosage, not to mention of getting physically nailed to death by whatever is trekking past or through your personal space at 30+ km/s.
