Big Bertha Thing virus

18th October 1999

Hi Chris,

Thanks for the Keyboard.drv, but Windows is still down.

The new messages are;

1. Clock General Protection Fault in gdi.exe (system)
2. Progman Ditto krnl386.exe (system)

Clock.exe see windows. Progman.exe see windows.

The two options seem to be, to try another four files
for windows 3.11 or save up and update PC. (130 pounds)

They have a nice 486DX66 16MB 270MB hard-drive 14" SVGA
and win 95, at the same place I bought the 386PC. It
is four times faster too. My biggest program takes 7 hours
on standard IBM PC, 90 minutes on 386 and 20 minutes on
486DX, which has a built in maths co-processor.

sci.space.shuttle: Re: Big Bertha Thing blogs

My DOS browser can read newsgroups, send/receive e-mail, browse web, but not receive attachments, look up my own site or update it.

Keyboard.drv worked, but closed down every app in windows, so there was no way out. Clever that. The scrub round was in the book, for bypassing emm386. Wait till boot up gets to MSDOS loading and press F8. Step through Config.sys line-by-line with y answer. It then goes through autoexec.bat to last line of win. N answer drops you out to DOS prompt.

Strange to say I can still work on my science maths project using Fortran 77 in DOS. Apps down with windows are Free Agent, WS-ftple, Winzip, F-Prot, Anyware Virus, Chekmate Virus, FirstClass client.

It looks like I picked up a macro virus off a wordperfect attachment from e-mail of a guy in newsgroup. Three virus apps missed it. It is visible in notepad view of file after saving with write.exe. Isolate 386 and do not update site.

You might check that my site is still up, by the back door and let me know the count. <www.bertha.ndirect.co.uk/series.htm>

It could not have happened to a nicer chap.
Thank you,
Tony Lance

Big Bertha Thing designer

Once there was Big Blue, Baby Bell and Pax IBM.
Now ther is Big Bertha, Baby Bill and Pax Microsoft.

1980 The Greater London Council, Central Computer Service installation standards for IBM mainframe had standard date subroutines as mandatory.

1980 No standards for Prime minicomputer, so date subroutine for program was written to be 2075 OK, by me.

All IBM customers and suppliers applied IBM standards. Enforcement of these standards means that the following instances can only be designer software obsolescence.(Smoking Gun features.)

1. First PC operating system DOS was written 1980 (IBM/Microsoft) No 2000
2. Next PC operating system MS-DOS (Microsoft) No 2000
3. Windows 95 enabled macro virus (Microsoft) admitted
4. Windows 95 macro virus written by Microsoft.(admitted)
5. Windows 95 macro virus released by Microsoft.(admitted)
6. Windows 98 enabled text virus (Microsoft) admitted
7. Windows 98 no product recall, fix is on Microsoft website only.
8. Windows 98 to release virus just say it exists and fix is on website.

Re: Big Bertha Thing blogs

9. 1997 MS-DOS 6.20 licensed copy sold for Microsoft with no 2000.
10. 1999 Windows 3.11 virus closes all applications leaving no exit.

Big Bertha Thing history

1st virus was boot sector virus, which was first sector of floppy disc or start here sector.

2nd virus was program virus, which is enabled with on/off switch, by operating system as primary function thereof.(exe, sys, com)

3rd virus was macro virus, which is enabled with on/off switch, by wordprocessor or other application software.(doc)

4th virus was zip virus, which is enabled with on/off switch, by zip application software.(zip)

5th virus was text virus, which is enabled with on/off switch, by operating system as a purely viral function, otherwise unnecessary.(txt)
Since 1980 the text virus has been impossible. 18 years to crack it, with Windows 98 by Microsoft.

42 million Windows 3.xx users.

12 million e-mail only users.

Windows 95 not known.

Windows 98 not known.

Tony Lance

tonylance@big-bertha-thing.com

Big Bertha Thing corporate

1. What happened to the guys on the most wanted list?
2. Corporate America opened fire with an industrial strength denial of service attack.
3. It was complete with worm virus.
4. 150K mailbox postings.
5. Daily basis.
6. Unlimited smtp mailboxes and names.
7. Ownership of smtp mailbox provider.
8. This is a proprietorial interest in Usenet newsgroup postings.
9. Big Bertha is now on the list.
10. A sustainable defense would be nice.
11. When the guns fall silent, the battle will be over.
12. There were enough shells for 42 months, without recycling.

Big Bertha Thing binary

sci.space.shuttle: Re: Big Bertha Thing blogs

The defense is of course binary; the old one two.
You need two filters.
The first blocks mailbox entry and strips out the from mailbox address, for disclosure.
It uses mailbox address or suffix to select postings.
The second uses partial strings.
Any portion of the mailbox address or subject line to select postings.
It flags them as deleted and moves them to the trashcan.
The trashcan auto-deletes before the mailbox fills up.
Lastly you need vacation auto-reply and a mailing list, with an smtp mailbox.
The replies from auto reply tell you which mailboxes are closed.
The mailing list replies confirms which mailboxes are open.

NB There may be another case with the same protagonist:–

<http://groups.google.com/groups?selm=3e10cd57.0311261707.35b8cf51%40posting.google.com&oe=UTF-8&output>

Big Bertha Thing spamlock

One of the filters used includes the hosts shown as listed below.

1. These might be forgeries.
2. These might be global players carrying out denial of service attacks, on newsgroup users, to further corporate aims.
3. Each mailbox is one-way; it can send mail, but not receive it.
4. To control the attack, some mailboxes need to be two-way.
5. Microsoft.com was once on the two-way list, but seems to have thought better of it.
6. Aol.com was once on the two-way list, but seems to have thought better of it.
7. Yahoo.com is still on the two-way list.
8. Forgers do not ever think better of it.
9. This list was first compiled in January 2004.
10. The attack has now stopped, after 12 months.
11. This is one month after disclosure of mailbox logs, on usenet.
12. Denial of service attacks are illegal, so what is the FBI doing about it beyond prevarication?
13. The number of two-way mailboxes has been reduced to three major players.
14. Two of them are mentioned above. (Possibly all three.)
15. Microsoft in their recent unsuccessful proposal, wanted the internet to use their patented software for identification of mailboxes. (Anti-open source) See
